

This is a photo of what developed in the blood mixed with the C19 Pfizer shot contents.

They left it overnight and it was still very pronounced. You can see that the red blood cells have oxidative stress, meaning they have spikes on their surface. The structure is clearly seen:

Humanity United Now - Ana Maria Mihalcea, MD, PhD

In the following video unvaccinated blood is shown before doing an experiment and adding Pfizer shot contents to the live blood. You can see the blood looks pretty normal in this person:

This is what happens immediately after adding the C19 vial contents to the blood - the blood starts aggregating. The doctor notes that this is not classical rouleaux or stacking of the red blood cells but an irregular clumping and aggregation. It develops
